

ABSTRACT OF THE DISCLOSURE

Footwear includes an upper leather and a shoe sole bonded at its upper portion to the upper leather. The upper leather is formed in a shape enclosing the instep of a foot, and has a  
5 bottom opening rim closely resembling the outer shape of the sole of the foot. A pan member is bonded to the front part of the bottom opening rim of the upper leather. The front part of the upper leather is formed in a shape of a bag to enclose a toe. In the pan member, a shock absorber including a gel is  
10 provided. Thus, the shock absorber can be stably located at the toe during walking. Therefore, the shock absorber can surely absorb a large impact on the toe, thus greatly reducing fatigue, pains, or the like of the foot. Moreover, by forming the shock absorber with use of the gel, a sense of fitting  
15 when a wearer wears the footwear for the first time can be kept permanently and absorption of an impact on the toe can be performed permanently.
